

Thank you 3Dprintingsystems Australia from everyone at the Bungara Alternative School in Bundaberg!

We would like to let you know that we are very impressed with the performance of our new UP Box+ and UP mini 2 printers.

Personally as someone who has used older style 3D printers in the past, from Makerbot replicators, Ultimaker and kit form Prusa i3 models I can say that the performance and ease of operation of these printers is unbelievable. We literally took them out of the box, turned them on and started printing with stunning results!

The ability of these printers to resume printing after they run out of filament is a fantastic feature which I was initially a bit skeptical about, but now that we have seen how it works so well, without leaving any visible trace that this has occurred gives me a great amount of confidence in leaving these printers to work knowing that I can quickly and easily work around either of them running out of filament.

We are doing a unit this term on the Star Wars extended universe and asking students to create and print something from the Star Wars world. These printers are allowing us to create some really excellent models that we can then use as movie props, animation, for display and they have generated an intense amount of interest in our students (who want to take them home).
